### Description of Related Art

The extracellular matrix (ECM) is the major component of connective tissue which provides structural integrity, and promotes cell migration and differentiation. As part of these functions, extracellular matrix molecules such as fibronectin, collagen, laminin, von Willebrand factor, thrombospondin, fibrinogen, and tenascin have been shown to support adhesion of cells *in vitro*. This adhesive interaction is critical for a number of biological processes including hemostasis, thrombosis, wound healing, tumor metastasis, immunity and inflammation.

Fibronectin (FN) is the prototype ECM molecule. The major cell attachment site in the fibronectin molecule has been reproduced synthetically with the amino acid sequence arginine-glycine-aspartic acid, or RGD using single letter nomenclature. Peptides containing the RGD sequence which either inhibit or promote cell adhesion have been described (US Patent Nos. 4,589,881; 4,661,111; 4,517,686; 4,683,291; 4,578,079; 4,614,517; and 4,792,525). Changes in the peptide as small as the exchange of alanine for glycine or glutamic acid for aspartic acid, which constitute the addition of a single methyl or methylene group to the tripeptide, eliminates these activities (Pierschbacher et al., *Proc. Natl. Acad. Sci. USA* **81**:5985 (1984)). Recently, a second FN cell binding domain has been identified within the alternatively spliced region of the A chain of the molecule, known as the connecting segment 1 (CS-1). The most active cell-binding site within this alternatively spliced region is composed of 25 amino acids where the carboxy terminus contains the sequence

EILDVPST. The amino acid sequence EILDVPST forms a recognition motif on FN for cell surface receptors. (Wayner et al., *J. Cell Biol.* 109:1321 (1989); Guan et al., *Cell* 60:53 (1990)).

5 The receptors which recognize these sites on FN belong to a gene superfamily called integrins which consist of heterodimeric complexes of non-covalently associated alpha and beta subunits. A common  $\beta$  subunit combines with unique I subunits to form an adhesion receptor of defined specificity. To date, 8  $\beta$  subunits have been identified which can dimerize with 16 distinct I subunits forming 22 distinct integrins. The  $\beta 1$  subfamily, also known as the VLA family (Very Late Activation Antigens), binds to ECM molecules such as  
10 FN, collagen and laminin. For reviews, see, Hynes, *Cell* 48:549 (1987); Hemler, *Annu. Rev. Immunol.* 8:365 (1990). Leukocyte interaction with FN at the two spatially separate binding domains is mediated by two distinct integrins. The RGD site is recognized by the integrin  $\alpha_5\beta_1$ , while, EILDV is recognized by  $\alpha_4\beta_1$  (Pytela et al., *Cell* 40:191 (1985); Wayner et al., *J. Cell Biol.* 109:1321 (1989); Guan et al, *Cell* 60:53 (1990)).

15 Vascular endothelial cells form the interface between blood and tissues and control the passage of leukocytes as well as plasma fluid into tissues. A variety of signals generated at the site of inflammation can activate both endothelial cells as well as circulating leukocytes so that they become more adhesive to one another. Following this initial adhesion the leukocytes migrate into the tissues to perform host defense functions. Several  
20 adhesion molecules have been identified which are involved in leukocyte-endothelial interactions.

In the  $\beta_1$  subfamily, in addition to binding to fibronectin,  $\alpha_4\beta_1$  interacts with a cytokine inducible protein on endothelial cells termed vascular cell adhesion molecule (VCAM). Further involved in the leukocyte-endothelial adhesion process is the  $\beta_2$  integrin  
25 subfamily.  $\beta_2$  integrins include CD11a/CD18, CD11b/CD18, and CD11c/CD18. In addition, the  $\beta_2$  subunit associates with  $\alpha_4$  to form a unique  $\alpha_4\beta_2$  heterodimer which binds to FN, to VCAM, and to Mucosal Addressin Cell Adhesion Molecule-1 (MAdCAM) (Ruegg et al, *J. Cell.Biol.* 117:179 (1992); Andrew et al., *J. Immunol.* 153:3847 (1994); Briskin et al., *Nature* 363:461 (1993); Shyjan et al, *J. Immunol.* 156:2851 (1996)).  $\alpha_4$  integrins are widely  
30 expressed on different cell types including hematopoietic progenitors, lymphocytes, natural

killer cells, monocytes, eosinophils, basophils, and mast cells (Helmer, M. E., *Annu. Rev. Immunol.* 8:365 (1990)). Other molecules on endothelial cells which bind to the leukocytes include ICAM-1, ICAM-2, E-selectin and P-selectin (Carlos and Harlan, *Immunol. Rev.* 114:1 (1990); Osborn, L., *Cell* 62:3 (1990); Springer T., *Nature* 346:425 (1990); Geng et al.,  
5 *Nature* 347:757 (1990); Stoolman, *Cell* 56:907 (1989)).

A number of *in vitro* and *in vivo* studies indicate that  $\alpha_4\beta_1$  plays a critical role in the pathogenesis of a variety of diseases. Monoclonal antibodies directed against  $\alpha_4$  have been tested in a variety of disease models. Anti- $\alpha_4$  antibodies block adhesion of lymphocytes to synovial endothelial cells; this adhesion plays a potential role in rheumatoid arthritis (van  
10 Dinther-Janssen et al, *J. Immunol.* 147:4207 (1991)).  $\alpha_4$  has also been implicated with respect to rheumatoid arthritis in separate studies (Laffon et al, *J. Clin. Invest.* 88:546 (1991); Morales-Ducet et al, *J. Immunol.* 149:1424 (1992)). A significant number of studies have evaluated the role of  $\alpha_4$  in allergy and asthma. For example, monoclonal antibodies to  $\alpha_4$  block adhesion of basophils and eosinophils to cytokine activated endothelial cells (Walsh et  
15 al, *J. Immunol.* 146:3419 (1991); Bochner et al, *J. Exp. Med.* 173:1553 (1991)). Monoclonal antibodies to  $\alpha_4$  were also effective in several lung antigen challenge models (Abraham et al, *J. Clin. Invest.* 93:776 (1994); Weg et al, *J. Exp. Med.* 177:561 (1993)). The cotton-top tamarin, which experiences spontaneous chronic colitis, showed a significant attenuation of their colitis when anti- $\alpha_4$  antibody was administered (Podolsky et al, *J. Clin.*  
20 *Invest.* 92:372 (1993); Bell et al, *J. Immunol.* 151:4790 (1993)). In a rat and mouse model, autoimmune encephalomyelitis was blocked by anti- $\alpha_4$  antibody (Yednock et al, *Nature* 356:63 (1992); Baron et al, *J. Exp. Med.* 177:57 (1993)). Anti- $\alpha_4$  monoclonal antibodies also inhibit insulinitis and delay the onset of diabetes in the non-obese diabetic mouse (Baron et al, *J. Clin. Invest.* 93:1700 (1994); Yang et al, *Proc. Natl. Acad. Sci. USA* 90:10494  
25 (1993); Burkly et al, *Diabetes* 43:529 (1994)).  $\alpha_4$  is also implicated in atherosclerosis due to its endothelial expression during atherogenesis (Cybulsky et al, *Science* 251:788 (1991)). The migration of leukocytes to an inflammatory site can also be blocked by anti- $\alpha_4$  antibodies. In addition to the blocking of migration, inhibitors of leukocyte endothelial adhesion may block the costimulatory signals mediated by integrins and thus inhibit  
30 overproduction of inflammatory cytokines. In a separate set of experiments not using anti- $\alpha_4$

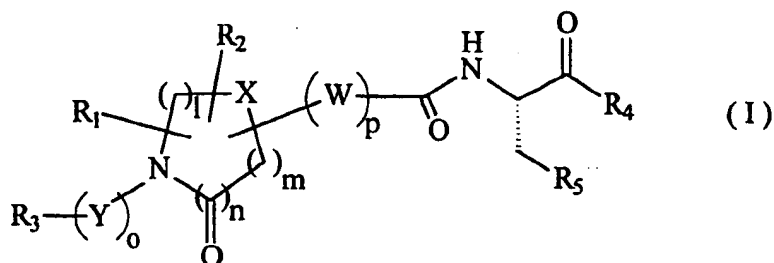

antibodies, the peptides GRDGSP or EILDV were tested against contact hypersensitivity response. The contact hypersensitivity response was found to be blocked by GRDGSP or EILDV suggesting that both  $\alpha_4\beta_1$  and  $\alpha_5\beta_1$  are involved in this inflammatory response.

Other ailments which may involve  $\alpha_4\beta_1$ -mediated conditions include the inflammatory disorders rheumatoid arthritis, allergic disorders, asthma, spontaneous chronic colitis, insulinitis, contact hypersensitivity response, atherosclerosis and autoimmune encephalomyelitis. These studies illustrate that small molecules that are potent inhibitors of  $\alpha_4\beta_1$  mediated adhesion to either VCAM-1 or CS-1 may be used as a form of treatment in numerous inflammatory diseases. However, these inflammatory conditions could be expanded to include adult respiratory distress syndrome, AIDS, cardiovascular diseases, thrombosis or harmful platelet aggregation, reocclusion following thrombolysis, allograft rejection, reperfusion injury, psoriasis, eczema, contact dermatitis and other skin inflammatory diseases, osteoporosis, osteoarthritis, atherosclerosis, neoplastic diseases including metastasis of neoplastic or cancerous growth, wound healing enhancement, treatment of certain eye diseases such as detaching retina, Type I diabetes, multiple sclerosis, systemic lupus erythematosus (SLE), inflammatory and immunoinflammatory conditions including ophthalmic inflammatory conditions and inflammatory bowel diseases, ulcerative colitis, regional enteritis and other autoimmune diseases. Accordingly, a compound which could inhibit these conditions is desirable.

In the above formula (I) the absolute stereochemistry for the bond leading to R<sub>5</sub> is shown, however the absolute stereochemistry has not been shown for all examples which follow. It is understood that all other formulas also follow this type of absolute stereochemistry unless otherwise stated. Additionally, it is to be understood by those of skill in the art that the present invention embodies stereochemical configurations other than those shown. Specifically, the present invention embodies all configurations including the various stereoisomers. Compounds which do not meet the absolute stereochemistry in formula (I) should meet an activity threshold in various assays, to be explained below, which can ensure their efficacy as useful molecules. The present invention includes mixtures, such as racemic mixtures, which contain molecules having the claimed stereochemistry.

The desired compound of the present invention may be clinically used either in a free form or in the form of pharmaceutically acceptable salts thereof. Pharmaceutically acceptable salts include acid-addition salts with inorganic acid or organic acid (e.g., hydrochloride, sulfate, nitrate, hydrobromide, methanesulfonate, p-toluenesulfonate, acetate), salt with inorganic base, organic base or amino acid (e.g., triethylamine salt, a salt with lysine, an alkali metal salt, an alkali earth metal salt and the like).

The compound may also be formulated into a pharmaceutical composition comprising a therapeutically effective amount of the compound as defined above and a pharmaceutically acceptable carrier or diluent.

The compound can also be used for treating or preventing  $\alpha_4\beta_1$  adhesion mediated conditions in a mammal such as a human. This method may comprise administering to a

mammal or a human patient an effective amount of the compound or composition as explained above.

This method can be used to treat such inflammatory conditions as rheumatoid arthritis, asthma, allergy conditions, adult respiratory distress syndrome, AIDS, cardiovascular diseases, thrombosis or harmful platelet aggregation, reocclusion following thrombolysis, allograft rejection, reperfusion injury, psoriasis, eczema, contact dermatitis and other skin inflammatory diseases, osteoporosis, osteoarthritis, atherosclerosis, neoplastic diseases including metastasis of neoplastic or cancerous growth, wound healing enhancement, treatment of certain eye diseases such as detaching retina, Type I diabetes, multiple sclerosis, systemic lupus erythematosus (SLE), inflammatory and immunoinflammatory conditions including ophthalmic inflammatory conditions and inflammatory bowel diseases, ulcerative colitis, atherosclerosis, regional enteritis and other autoimmune diseases.

As mentioned above, the compounds and compositions containing the compounds according to the present invention are particularly useful in treating or preventing  $\alpha_4\beta_1$  adhesion mediated conditions in a mammal such as a human. The present inventors have found that the compounds and compositions containing the compounds according to the present invention are most useful in the treatment of asthma.

The desired compound of the present invention or pharmaceutically acceptable salts thereof may be administered either orally or parenterally, and it may be used as a suitable pharmaceutical preparation, for example, a tablet, a granule, a capsule, a powder, an injection, and an inhalation by a conventional process.

The dose of the desired compound of the present invention or a pharmaceutically acceptable salt thereof varies depending on an administration method, age, body weight, and state of a patient, but, in general, the daily dose is preferably about 0.1 to 100 mg/kg/day, however, 1 to 100 mg/kg/day may also be suitable.

Preferred routes of administration for asthma:

It is preferred that the compound of the present invention be administered in the form of an Aerosol. However, other routes of administration include intravenous, oral, intramuscular, and subcutaneous.

5 In the case of aerosol administration, compositions containing the compounds of the present invention can be prepared to provide for an excellent means for administering in aerosol form for inhalation therapy. Accordingly, the present invention will provide for self-propelling compositions containing the compounds of the present invention.

10 Propellants employed should be non-toxic and have a vapor pressure suitable for the conditions under which administration occurs. These propellants can be fluorinated or fluorochlorinated lower saturated aliphatic hydrocarbons. The preferred propellants of this type are the halogenated alkanes containing not more than two carbon atoms and at least one fluorine atom. Illustrative of these are trichloromonofluoromethane, dichlorodifluoromethane, monochlorotrifluoromethane, dichloromonofluoromethane and  
15 1,2-dichloro-1,1,2,2-tetrafluoroethane. These compounds are available from E.I. duPont de Nemours and Company under the trade name "Freon". These propellants may be employed singularly or in admixture.

In addition to the propellant, an organic solvent may also be employed. The organic solvent must be non-toxic and without undesirable effects on inhalation in the amount  
20 present in the aerosol produced. In addition, the solvent should be substantially anhydrous, completely miscible with the propellant or mixture of propellants employed and have a suitable boiling point. Examples of such solvents included non-toxic aliphatic alcohols such as ethanol; ethers such as ethyl ether and vinyl ether; ketones such as acetone; and suitable halogenated lower alkanes.

25 In addition to the organic solvent, the composition may also optionally contain a non-toxic hygroscopic glycol. The glycol must be substantially miscible with the organic solvent and the propellant employed. Satisfactory glycols include propylene glycol, triethylene glycol, glycerol, butylene glycol and hexylene glycol.

The above indicated methods of administration and formulation of aerosol  
30 compositions should not be viewed as limiting. The compounds of the present invention can

be formulated in anyway deemed suitable to one of ordinary skill in the art so as to obtain the desired effects.

#### Pharmaceutical Compositions

5           As indicated previously, the compounds of formula (I) can be formulated into pharmaceutical compositions. In determining when a compound of formula (I) is indicated for the treatment of a given disease, the particular disease in question, its severity, as well as the age, sex, weight, and condition of the subject to be treated, must be taken into consideration and this perusal is to be determined by the skill of the attendant physician.

10           For medical use, the amount of a compound of formula (I) required to achieve a therapeutic effect will, of course, vary both with the particular compound, the route of administration, the patient under treatment, and the particular disorder or disease being treated. A suitable daily dose of a compound of Formula (I), or a pharmaceutically acceptable salt thereof, for a mammalian subject suffering from, or likely to suffer from, any  
15 condition as described hereinbefore is 0.1 mg to 100 mg of the compound of formula I, per kilogram body weight of the mammalian subject. In the case of systematic administration, the dose may be in the range of 0.5 to 500 mg of the compound per kilogram body weight, the most preferred dosage being 0.5 to 50 mg/kg of mammal body weight administered two to three times daily. In the case of topical administration, e.g., to the skin or eye, a suitable  
20 dose may be in the range of 0.1  $\mu$ g to 100  $\mu$ g of the compound per kilogram, typically about 0.1  $\mu$ g/kg.

          In the case of oral dosing, a suitable dose of a compound of Formula (I), or a physiologically acceptable salt thereof, may be as specified in the preceding paragraph, but most preferably is from 1 mg to 10 mg of the compound per kilogram, the most preferred  
25 dosage being from 1 mg to 5 mg/kg of mammal body weight, for example, from 1 to 2 mg/kg. Most preferably, a unit dosage of an orally administrable composition encompassed by the present invention contains less than about 1.0 g of a formula (I) compound.

          It is understood that formulation, both for human and veterinary use, of the present invention may be presented to the mammal by inhalation. To achieve therapeutic effect, the  
30 dose may be in the range of 0.5 to 500 mg of the compound, per kg body weight. The most

preferred dosage being 0.5 to 50 mg/kg of mammal body weight administered two to three times daily.

It is understood that the ordinarily skilled physician or veterinarian will readily determine and prescribe the effective amount of a compound of formula (I) to prevent or arrest the progress of the condition for which treatment is administered. In so proceeding, the physician or veterinarian could employ relatively low doses at first, subsequently increasing the dose until a maximum response is obtained.

The compounds and compositions of the present invention can be administered to patients suffering from a condition listed herein in an amount which is effective to fully or partially alleviate undesired symptoms of the condition. The symptoms may be caused by inappropriate cell adhesion mediated by  $\alpha_4\beta_1$  integrins. Such inappropriate cell adhesion would typically be expected to occur as a result of increased VCAM-1 and/or CS-1 expression on the surface of endothelial cells. Increased VCAM-1 and/or CS-1 expression can be due to a normal inflammation response or due to abnormal inflammatory states. In either case, an effective dose of a compound of the invention may reduce the increased cell adhesion due to increased VCAM-1 expression by endothelial cells. Reducing the adhesion observed in the disease state by 50% can be considered an effective reduction in adhesion. More preferably, a reduction in adhesion by 90%, is achieved. Most preferably adhesion mediated by VCAM-1/ $\alpha_4\beta_1$  and/or CS-1 interaction is abolished by an effective dose. Clinically, in some instances, effect of the compound can be observed or a decrease in white cell infiltration into tissues or a site of injury. To achieve a therapeutic effect, then, the compounds or compositions of the present invention are administered to provide a dose effective to reduce or eliminate inappropriate cell adhesion or to alleviate undesired symptoms.

While it is possible for an active ingredient to be administered alone, it is preferable to present it as a pharmaceutical formulation comprising a compound of formula (I) and a pharmaceutically acceptable carrier thereof. Such formulations constitute a further feature of the present invention.

The formulations, both for human and veterinary medical use, of the present invention comprise an active ingredient of formula (I), in association with a pharmaceutically

acceptable carrier thereof and optionally other therapeutic ingredient(s), which are generally known to be effective in treating the disease or condition encountered. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulations and not deleterious to the recipient thereof.

5           The formulations include those in a form suitable for oral, pulmonary, ophthalmic, rectal, parenteral (including subcutaneous, intramuscular, and intravenous), intra-articular, topical, nasal inhalation (e.g., with an aerosol) or buccal administration. Such formulation are understood to include long-acting formulations known in the art.

10           The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods may include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the  
15           desired form.

Formulations of the present invention suitable for oral administration may be in the form of discrete units such as capsules, cachets, tablets, or lozenges, each containing a predetermined amount of the active ingredient in the form of a powder or granules; in the form of a solution or suspension in an aqueous liquid. Formulations for other uses could  
20           involve a nonaqueous liquid; in the form of an oil-in-water emulsion or a water-in-oil emulsion; in the form of an aerosol; or in the form of a cream or ointment or impregnated into a transdermal patch for use in administering the active ingredient transdermally, to a patient in need thereof. The active ingredient of the present inventive compositions may also be administered to a patient in need thereof in the form of a bolus, electuary, or paste.

## Scheme A

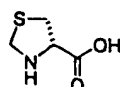

$R_{A-1}$  and  $R_{A-2}$  are defined independently as  $R_1$ .

Scheme A describes a general method for the preparation of examples of the formula A-5, A-6, A-7, A-8, A-9 and A-10. A commercially available or readily prepared sulfur containing amino acid of structure A-1 (for the synthesis of  $\beta,\beta$ -disubstituted cysteine amino acids see: Stanfield, G.F.; Hruby, V.J. *Synth. Commun.* **1988**, *18*, 531 and references therein) is condensed with formaldehyde to afford the thiazolidine-4-carboxylic acid of general formula A-2 (for the condensation of aldehydes with cysteine or similar sulfur containing amino acids see for example: (a) Ratner, S.; Clark, H.T. *J. Am. Chem. Soc.* **1937**, *59*, 200. (b) Lewis, N.J.; Inloes, R.L.; Hes, J.; Matthews, R.H.; Milo, G. *J. Med. Chem.* **1978**, *21*, 1070. (c) Oya, M.; Baba, T.; Kato, E.; Kawashima, Y.; Watanbe, T. *Chem. Pharm. Bull.* **1982**, *30*, 440.). Standard protection affords carbamate A-3 which is readily condensed with amino acid derivative A-4 under standard peptide synthesis conditions to provide the psuedodipeptide A-5 (for a review of procedures of peptide synthesis see: Bodansky, M.; Bodansky, A. *The Practice of Peptide Synthesis*; Springer-Verlag: Berlin, 1984). Deprotection of the carbamate from A-5 provides the useful intermediate A-6. The amine group may be reacted with a variety of electrophilic reagents such as: (1) commercially available or readily prepared sulfonyl chlorides (for the synthesis of sulfonyl chlorides see for examples: (a) Roblin, R.O.; Clapp, J.W. *J. Am. Chem. Soc.* **1950**, *72*, 4890. (b) Gilbert, E.E. in *Sulfonation and Related Reactions* Olah, G.A., Ed. John Wiley and Sons, New York; 1965. (c) Park, Y.J.; Shin, H.H.; Kin, Y.H. *Chem Lett.* **1992**, 1483. (d) Kim, D.; Ko, Y.K.; Kim, S.H. *Synthesis*, **1992**, 1203.) to afford sulfonamides of general structure A-7 where Y is  $SO_2$ - (preparation 5); (2) carbonates or chloroformates to afford carbamates of general structure A-7 where Y is  $CO_2$ - (preparations 2, 7, 8); (3) isocyanates to afford ureas of general structure A-7 where Y is  $CONHR_3$  (preparation 9); (4) phosgene or a suitable equivalent and an amine to afford ureas of general structure A-7 where Y is  $CON(C_{1-6}alkyl)R_3$ - (preparation 10, also see for example: Nowick, J.S.; Homes, D.L.; Noronha, G.; Smith, E.M.; Tram, M.N.; Huang, S. *J. Org. Chem.* **1996**, *61*, 3929.); (5) acid chlorides and carboxylic anhydrides to provide amides of structure A-7 where Y is  $CO$ - (preparation 11). Mild base hydrolysis of monoesters of general structure A-7 (preparation 6) or diesters of general structure A-7

(preparation 12) affords the acids of general structure A-8. Mild base hydrolysis of the ester of general structure A-5 provides acid A-9 (preparation 6 or 13) which may be further deprotected to afford the amino acid A-10 (preparation 14).

The title compound was prepared by a modification of the literature procedure of Ghosh, A.K.; Duong, T.T.; McKee, S.P.; Thompson, W.J. *Tetrahedron Lett.* **1992**, *33*, 2781. To a solution of 1-(2-hydroxyethyl)piperidine (5.11 g, 39.6 mmol) in CH<sub>3</sub>CN (220 mL) at ambient temperature was added N,N-disuccinimidyl carbonate (10.13 g, 39.6 mmol) and triethylamine (16.6 mL, 118.8 mmol). The solution was stirred at room temperature for 4 h and concentrated *in vacuo* to give a viscous oil. The oil was dissolved in a minimal amount of methylene chloride (50 mL) and added to a solution of A-6 (Scheme A, where R<sub>A-1</sub> and R<sub>A-2</sub> are the same and equal to H, R<sub>5</sub> is 4-[(2,6-dichlorophenyl)methoxy]phenyl and stereochemistry is (S, S)) (2.0 g, 3.96 mmol), triethylamine (0.60 mL) and DMAP (5 mg) in CH<sub>2</sub>Cl<sub>2</sub> (10 mL). The solution was stirred overnight and an additional 5 equivalents of carbonate in methylene chloride (10 mL) [prepared as described above from N,N-disuccinimidyl carbonate (5.6 g, 19.8 mmol), triethylamine (8.3 mL, 59.4 mmol), and 1-(2-hydroxyethyl)piperidine (2.56 g, 19.8 mmol)] were added. After 3 h at room temperature, propylamine (30 mL, 0.71 mol) was slowly added (*exothermic*) and the solution diluted with CH<sub>2</sub>Cl<sub>2</sub>. The resulting solution was stirred vigorously for 15 min. and diluted with water. The organic layer was separated and washed with 0.1 M HCl, sat. aqueous NaHCO<sub>3</sub>, dried (MgSO<sub>4</sub>), filtered and concentrated *in vacuo*. Purification of the residue by flash chromatography using ethyl acetate/methylene chloride (3:1) as eluant

## Scheme B

where  $R_{B-1}$ ,  $R_{B-2}$ ,  $R_{B-3}$ , and  $R_{B-4}$  are defined as  $R_1$  and in addition  $R_{B-3}$  and  $R_{B-4}$  may be attached to the same carbon atom and form a cyclic ring of 5-8 atoms of the formula:

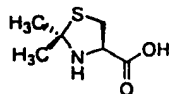

together with the carbon atom to which they are attached;  $R_{B-5}$  is defined as OH or O-(C<sub>1-6</sub> alkyl)

Scheme B describes a general method for the preparation of thiazolidine-4-carboxylic acid derivatives of general structure **B-6**, **B-7** and **B-8** which are disubstituted at the 2 position (i.e.,  $R_{B-3}$  and  $R_{B-4}$  are not equal to H). Within this class of structures, the nitrogen is derivatized immediately after forming the heterocyclic ring. Accordingly, a commercially available or readily prepared sulfur-containing amino acid of structure **B-1** (which is the same structure as **A-1**) is condensed with a commercially available or readily prepared ketone to afford the thiazolidine-4-carboxylic acid of general formula **B-3** (preparation 15) (for a general discussion of the condensation of aldehydes and ketones with cysteine or similar sulfur containing amino acids see: Coppola, G.M.; Schuster, H.F. *Asymmetric Synthesis: Construction of Chiral Molecules Using Amino Acids*; John Wiley: New York, 1987; Chapter 6, 171.). The amine group may be reacted with a variety of electrophilic reagents such as sulfonyl chlorides, carbonates, chloroformates, isocyanates, phosgene (or a suitable equivalent) and an amine, acid chlorides, and carboxylic acid anhydrides as described in Scheme A for the reaction of **A-6**. Preparation 16 is provided as a specific example of the synthesis of a compound of general structure **B-4**. Condensation of **B-4** with amino acid derivative **B-5** under standard peptide synthesis conditions provides the compound of general structure **B-6** (preparation 17). Mild base hydrolysis of the methyl ester of general structure **B-6** (where  $R_{B-5}$  is OCH<sub>3</sub>) may be effected as described and exemplified in Scheme A (preparation 6 or 13) to afford compounds of the general structure **B-7**. Alternatively, in those cases where  $R_{B-5}$  is O-*t*-Bu, mild acidolysis can also provide compounds of the general structure **B-7** (by the procedure described in preparation 4 of Scheme A). In the case of *t*-butoxycarbonyl derivatised analogs of general structure **B-7** (i.e. where  $R_3$  is *t*-butyl and Y is CO<sub>2</sub>), mild

acidolysis affords compounds of general structure **B-8** (by the procedure described in preparation 4 of Scheme A).

A suspension of L-cysteine hydrochloride monohydrate (Scheme B, **B-1**: where  $R_{B-1}$  and  $R_{B-2}$  are the same and equal to H and stereochemistry is (*R*)) (20 g, 0.11 mol) in acetone (Scheme B, **B-2**: where  $R_{B-3}$  and  $R_{B-4}$  are equal to  $CH_3$ ) (800 mL) was heated to reflux for 8 h. The reaction mixture was stirred for 2 days and volatiles removed *in vacuo*. The residue was slurried in

diethyl ether and filtered through a pad of celite. The filtrate was washed with 0.1 N HCl, water, brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated in vacuo. ## Scheme C

## Scheme C (continued)

5       Where:  $R_{C-1}$ ,  $R_{C-2}$ , and  $R_{C-3}$  are defined independently as  $R_1$ .  $R_{C-4}$  is defined as  $R_2$ .

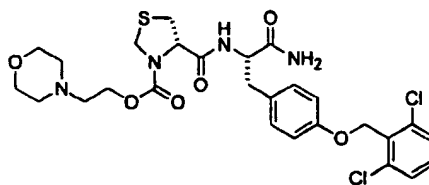

Scheme C describes a method for the preparation of examples of the formula **C-10**. Commercially available Rink Amide MBHA resin is deprotected under standard solid-phase peptide synthesis conditions (Atherton, E.; Sheppard R.C. *Solid Phase Peptide Synthesis: A Practical Approach*; IRL Press at Oxford University Press: Oxford, 1989) to afford the amine of formula **C-2**. Acylation with a commercially available or readily prepared amino acid residue of general **C-3** affords the resin bound derivative of formula **C-4**. Removal of the Fmoc group under standard conditions provides amine of general structure **C-5** which is acylated with a commercially available or readily prepared thiazolidine-4-carboxylic acid of general formula **C-6** to afford the resin bound intermediate **C-7**. Standard Fmoc deprotection affords the resin bound amine of general formula **C-8** which may be reacted with a variety of electrophilic reagents as described in Scheme A to afford resin bound amides, ureas, sulfonamides and carbamates of general structure **C-9**. Preparation 18 details an example of the reaction of a mixed carbonate to

afford a carbamate of general structure C-9 (where Y is equal to CO<sub>2</sub>). Standard acidolysis affords the amide of general structure C-10.

5 Preparation 18 and Example 89.

[S-(R\*,R\*)]-4-[[[1-[[4-[(2,6-Dichlorophenyl)methoxy]phenyl]methyl]-2-amino-2-oxoethyl]amino]carbonyl]-3-thiazolidinecarboxylic acid 3-[2-(4-morpholinyl)ethyl] ester

(Scheme C, C-10: where R<sub>C-1</sub>, R<sub>C-2</sub>, R<sub>C-3</sub> and R<sub>C-4</sub> are the same and equal to proton, R<sub>3</sub> is 2-(4-morpholinyl)ethyl, R<sub>5</sub> is 4-[(2,6-dichlorophenyl)methoxy]phenyl, Y is CO<sub>2</sub> and stereochemistry is (S, S)).

15 To a mixture of Rink Amide MBHA resin (Scheme C, C-1) (Nova Biochem., 1.2 g, ca. 0.59 mmol) in methylene chloride (20 mL) was added a solution of piperidine in DMF (30%, 20 mL). A slow stream of nitrogen was bubbled through the mixture to effect mixing for 20 min. The resin was filtered and washed with DMF. The resin was suspended in a solution of piperidine in DMF (30%, 40 ml) and mixed for 40 min. The resin was filtered and washed with DMF, methylene chloride, methanol and methylene chloride to afford resin C-2, which was diluted with DMF (40 mL). To this mixture was added Fmoc-Tyr(2,6-Cl<sub>2</sub>-Bn) (Scheme C, C-3: where R<sub>5</sub> is 4-[(2,6-dichlorophenyl)methoxy]phenyl and stereochemistry is (S)) (Advanced Chemtech, 1.32 g, 2.35 mmol), HOBt (0.36 g, 2.35 mmol), PyBOP (1.20 g, 2.35) and DIEA (1.03 mL, 5.90 mmol). The reaction was mixed for 4 h and the resin filtered and washed with DMF, methylene chloride, MeOH and methylene chloride to afford the intermediate resin-bound

amino acid derivative C-4 (Scheme C, where  $R_s$  is 4-[(2,6-dichlorophenyl)methoxy]phenyl and stereochemistry is (*S*)) which was used without characterization.

To a mixture of resin C-4 described above in methylene chloride (20 mL) was added a solution of piperidine in DMF (30%, 20 mL). A slow stream of nitrogen was bubbled through the mixture to effect mixing for 20 min. The resin was filtered and washed with DMF. The resin was suspended in a solution of piperidine in DMF (30%, 40 ml) and mixed for 40 min. The resin was filtered and washed with DMF, methylene chloride, methanol and methylene chloride to afford the resin of structure C-5 (Scheme C, where  $R_s$  is 4-[(2,6-dichlorophenyl)methoxy]phenyl and stereochemistry is (*S*)), which was diluted with DMF (40 mL). To this mixture was added Fmoc-D-thiazolidine-4-carboxylic acid (Scheme C, C-6: where  $R_{C-1}$ ,  $R_{C-2}$ ,  $R_{C-3}$  and  $R_{C-4}$  are the same and equal to proton and stereochemistry is (*S*)) (Advanced Chemtech, 832 mg, 2.35 mmol), HOBt (0.36 g, 2.35 mmol), PyBOP (1.20 g, 2.35) and DIEA (1.03 mL, 5.90 mmol). The reaction was mixed for 4 h and the resin filtered and washed with DMF, methylene chloride, MeOH and methylene chloride to afford the intermediate resin-bound derivative C-7 (Scheme C, where  $R_{C-1}$ ,  $R_{C-2}$ ,  $R_{C-3}$  and  $R_{C-4}$  are the same and equal to proton,  $R_s$  is 4-[(2,6-dichlorophenyl)methoxy]phenyl and stereochemistry is (*S*, *S*)) which was used without characterization.

To a mixture of resin C-7 described above in methylene chloride (20 mL) was added a solution of piperidine in DMF (30%, 20 mL). A slow stream of nitrogen was bubbled through the mixture to effect mixing for 20 min. The resin was filtered and washed with DMF. The resin was suspended in a solution of piperidine in DMF (30%, 40 ml) and mixed for 40 min. The resin was filtered and washed with DMF, methylene chloride, methanol and methylene chloride to provide the intermediate of structure C-8 (Scheme C, where  $R_{C-1}$ ,  $R_{C-2}$ ,  $R_{C-3}$  and  $R_{C-4}$  are the same and equal to proton,  $R_s$  is 4-[(2,6-dichlorophenyl)methoxy]phenyl and stereochemistry is (*S*, *S*)), which was diluted with methylene chloride (10 mL). To this mixture was added a solution of the mixed carbonate prepared from 4-(2-hydroxyethyl)morpholine (2.14 mL, 17.7 mmol) and N,N-disuccinimidyl carbonate (4.53 g, 17.7 mmol) as described in preparation 8 in methylene chloride (20 mL) followed by triethylamine (0.33 mL, 2.36 mmol). The reaction was

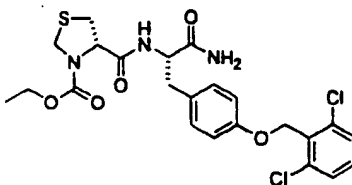

mixed for 24 h and the resin filtered and washed extensively with DMF, methylene chloride, MeOH, and anhydrous ethyl ether. The resin was dried *in vacuo* to afford the resin-bound carbamate C-9 (Scheme C, where  $R_{C-1}$ ,  $R_{C-2}$ ,  $R_{C-3}$  and  $R_{C-4}$  are the same and equal to proton,  $R_3$  is 2-(4-morpholinyl)ethyl,  $R_5$  is 4-[(2,6-dichlorophenyl)methoxy]phenyl, Y is  $CO_2$  and stereochemistry is (*S*, *S*)).

Resin C-9 was swelled with a minimum of methylene chloride (ca. 2 mL) and suspended with 95 % aqueous TFA (20 mL). The mixture was mixed by magnetic stirring for 1h and filtered. The resin was washed with additional TFA (2 X 5 mL), followed by methylene chloride and methanol. The combined filtrates were evaporated *in vacuo*, and partitioned between ethyl acetate and saturated aqueous sodium bicarbonate. The organic layer was separated and washed with brine, dried ( $MgSO_4$ ), filtered and evaporated *in vacuo*. The residue was purified by flash chromatography using methylene chloride/methanol (1 to 3%) as eluant to afford the title compound (215 mg) as an amorphous powder: IR (mull) 3288, 1676, 1657, 1611, 1564, 1511, 1439, 1424, 1346, 1302, 1237, 1179, 1116, 1021, 767  $cm^{-1}$ ;  $^1H$  NMR ( $CDCl_3$ , 300 MHz)  $\delta$  7.24 (5 H), 6.93 (2 H), 5.20 (2 H), 4.63 (3 H), 4.34 (1 H), 4.22 (2 H), 3.63 (4 H), 3.11 (4 H), 2.50 (6 H);  $^{13}C$  NMR ( $CDCl_3$ , 75 MHz)  $\delta$  173.4, 170.1, 157.9, 154.5, 136.9, 132.0, 130.4, 129.1, 128.4, 115.1, 66.8, 65.2, 63.4, 57.1, 54.0, 53.7, 53.5, 49.4, 35.2; MS (EI)  $m/z$  (rel. intensity) 610 ( $M^+$ , 1), 323 (13), 321 (20), 161 (34), 159 (53), 114 (31), 113 (98), 100 (99), 88 (13), 70 (8), 56 (11); MS (FAB)  $m/z$  (rel. intensity) 611 ( $MH^+$ , 71), 614 (18), 613 (49), 612 (27), 611 (71), 123 (60), 114 (99), 113 (76), 112 (19), 107 (22), 100 (28); HRMS (FAB) calcd for  $C_{27}H_{32}Cl_2N_4O_6S + H$ , 611.1498, found 611.1494. Scheme D describes a method for the preparation of examples of general formula D-9. Commercially available or readily prepared N- $\alpha$ -Fmoc protected amino acids of general structure D-1 are coupled with *O*-(*tert*-butyl)hydroxylamine (D-2) under standard coupling conditions as previously referenced to afford the *t*-butyl hydroxamate of general structure D-3. Standard Fmoc deprotection affords the intermediate amine of formula D-4. Coupling of this amine with a commercially available or readily prepared N- $\alpha$ -Fmoc-thiazolidine-4-carboxylic acid of general structure D-5 affords the pseudodipeptide intermediate of general structure D-6. Standard Fmoc deprotection affords the intermediate amine of general structure D-7 which may be reacted under the variety of conditions described in Scheme A to afford amides, carbamates, sulfonamides and ureas of general structure D-8. Preparation 22 provides a specific example of the reaction of an amine of general structure D-7 with a carbonate to afford a carbamate of general structure D-8. Mild acidolysis affords the hydroxamate of general structure D-9.

Scheme F

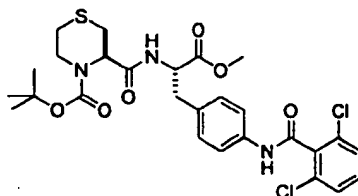

Where R<sub>F-3</sub> is defined as proton or C<sub>1-6</sub> alkyl.

Scheme F describes a general method for the preparation of examples of the formula F-4, F-5, F-6, F-7, and F-8. A commercially available or readily prepared sulfur containing amino acid of structure F-1 is condensed with amino acid derivative F-2 under standard peptide synthesis conditions as described in Scheme A. Deprotection of the carbamate from F-3 provides the useful intermediate F-4. The amine group may be reacted with a variety of electrophilic reagents as described in Scheme A to provide esters of general structure F-5. Mild base hydrolysis provides acids of structure F-6. Mild hydrolysis of esters of general structure F-3 provides acid of formula F-7. In those cases in which  $R_{F-3}$  is equal to *t*-butyl, mild acidolysis of compounds of general structure F-3 afford the amino acid of general structure F-8.

Scheme G

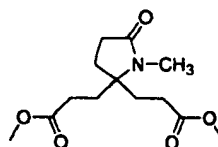

Where  $R_{G-1}$  and  $R_{G-2}$  are defined independently as H or  $CH_3$ ;  $R_{G-3}$  is defined as H,  $C_{1-6}$  alkyl or  $C_{3-6}$  alkenyl; and  $g$  is defined as 0 or 2.

Scheme G describes a general method to prepare lactam examples of general structures G-5 and G-6. Readily prepared lactams of general structure G-1 may be alkylated by the reaction of an appropriate alkylating in the presence of a suitable base as described in preparation 37 to provide intermediates of general structure G-2. Mild hydrolysis provides the monoacid of general structure G-3 which may be condensed with an amino acyl intermediate of structure G-4 as described in Scheme A. Full hydrolysis of the diester of general structure G-5 affords the diacid of structure G-6.

## Scheme H.

Scheme H teaches a general method for the preparation of 6-chloroazatyrosine examples of structures **H-4** and **H-5**, by adaption of the methodology for the preparation of protected azatyrosine reagents as described by Kawata, S.; Ashizawa, S.; Hirama, M. *J. Am. Chem. Soc.* **1997**, *119*, 12012-12013 and references cited therein. Thus regioselective iodination of 2-chloro-3-pyridinol gives the chloro-iodopyridinol **H-2**, that is *O*-alkylated as exemplified by the synthesis of **H-3**. Palladium-catalyzed reaction of **H-3** with the organozinc derived from a suitably protected  $\beta$ -iodoalanine, provides the protected 5-chloroazatyrosine **H-4**. *N*-deprotection of **H-4** gives the aminoester **H-5**, that is used (as exemplified by reagent **A-4** of Scheme A, and by reagent **B-5** of Scheme B) for the synthesis of Examples of this invention

#### Preparation 41.

(Scheme H: **H-2**)

**2-Chloro-6-iodo-3-pyridinol** ( $C_5H_3ClINO$ ).

To a solution of 2-chloro-3-pyridinol **H-1** (10.2 g, 78.7 mmol) and  $K_2CO_3$  (38.9 g, 0.274 mol) in  $H_2O$  (120 mL) is added  $I_2$  (24.3 g, 95.8 mmol), and the reaction mixture is stirred at rt for 4 h. The reaction mixture is quenched by the addition of aq satd  $Na_2S_2O_3 \cdot 5H_2O$ , and its pH is lowered to pH 2 with the addition of 12 M aq HCl. The mixture is extracted with EtOAc. The combined EtOAc extracts are dried, filtered and concentrated to a yellow solid, that is crystallized from 120:25 heptane/EtOAc (145 mL) to give, as a yellow solid, 11.2 g of the title compound:  $^1H$  NMR ( $CD_3SOCD_3$ , 300 MHz)  $\delta$  9.87 (1H), 7.59 (1H), 7.06 (1H);  $^{13}C$  NMR ( $CD_3SOCD_3$ , 75 MHz)  $\delta$  150.68, 138.07, 134.98, 127.02, 101.18.

#### Preparation 42.

(Scheme H: **H-3**)

**2-Chloro-3-[(2,6-dichlorophenyl)methoxy]-6-iodopyridine** ( $C_{12}H_7Cl_3INO$ ).

To a solution of **H-2** (5.11 g, 20.0 mmol),  $PPh_3$  (5.30 g, 20.0 mmol), and 2,6-dichlorobenzylalcohol (3.54 g, 20.0 mmol) in dry THF (100 mL) at 0 °C under Ar is added

DEAD (3.15 mL, 20.0 mmol). The reaction mixture is kept at 0 °C for 1.5 h and at rt for 1.5 h. It is concentrated to a residue, that is purified by silica flash chromatography (17:3 hexanes/EtOAc) to give 7.61 g of the title compound: TLC (17:3 hexanes/EtOAc)  $R_f$  0.57;  $^1\text{H}$  NMR ( $\text{CD}_3\text{SOCD}_3$ , 300 MHz)  $\delta$  7.85 (1H), 7.62 (1H), 7.58–7.45 (3H), 5.34 (2H).

Scheme I.

Scheme I teaches a general method for the preparation of azatyrosine reagents **I-3**, **I-4**, **I-5**, **I-6** and **I-7**, by adaptation of the methodology for the preparation of protected azatyrosine reagents as described by Kawata, S.; Ashizawa, S.; Hiram, M. *J. Am. Chem. Soc.* **1997**, *119*, 12012-12013 and references cited therein. Thus *O*-protection of chloriodopyridinol **I-1** (identical to **H-2**) is followed by reaction with the organozinc, derived from a suitably protected  $\beta$ -iodoalanine, to provide the protected 6-chloroazatyrosine **I-3**. Reductive dehalogenation of **I-3** gives **I-4**, that is *O*-deprotected to give **I-5**. Reagent **I-5** is *O*-alkylated, as exemplified by the preparation of **I-6**. *N*-deprotection of **I-6** gives the aminoester **I-7**, that is used (as exemplified by reagent **A-4** of Scheme A, and by reagent **B-5** of Scheme B) for the synthesis of Examples of this invention.

Scheme L.

- 5 Scheme L teaches a general method for the preparation of *N*-alkylaryl azetidinedicarboxylic acid Examples L-4 and L-5, where  $R_{L-1}$  is  $C_{1-6}$  alkyl,  $R_{L-2}$  is  $C_{6-10}$  aryl and  $R_5$  is defined as in Scheme B. The *N*-phenylethyl-2,4-azetidinedicarboxylic acid dimethyl ester stereoisomers of general structure L1 were prepared as described (Hoshino, J.; Hiraoka, J.; Hata, Y.; Sawada, S.; Yamamoto, Y. *J. Chem. Soc. Perkin Trans. 1* 1995, 693-697) and
- 10 separated by silica flash chromatography. Thus partial saponification of diester L-1 gives

the half-acid L-2, that is coupled with reagent L-3 (as exemplified by the use of reagents A-3 and A-4 of Scheme A, and B-4 and B-5 of Scheme B) to provide Examples L-4, that are then hydrolyzed to Examples L-5 of this invention.

## Scheme M.

Scheme M teaches a general method for the preparation of *N*-acyl azetidinedicarboxylic acid Examples **M-6** and **M-7**, where  $R_{M-1}$  is  $C_{1-6}$  alkyl,  $R_{M-2}$  is  $C_{6-10}$  aryl, and  $R_3$ ,  $R_5$  and  $Y$  are defined as in Scheme B. Thus removal of the *N*-alkylaryl substituents  $R_{M-1}$  and  $R_{M-2}$  of **M-1** gives aminodiester **M-2**, that is acylated to provide **M-3**. Partial saponification of diester **M-3** gives half-acid **M-4**, that is coupled with reagent **M-5** (as exemplified by the use of reagents **A-3** and **A-4** of Scheme A, and **B-4** and **B-5** of Scheme B) to provide Examples **M-6**, that are then hydrolyzed to Examples **M-7** of this invention.

#### Preparation 63.

The mixture is filtered and concentrated to give the title compound as a colorless oil: TLC (4:1 Hexanes/EtOAc)  $R_f$  = 0.04;  $^1H$  NMR ( $CDCl_3$ )  $\delta$  4.33 (2H), 3.77 (6H), 3.38 (1H), 2.71 (2H); MS (+ESI)  $m/z$  174.2.

#### 20 (*2R-trans*)-1,2,4-Azetidinetricarboxylic acid 1-ethyl-2,4-dimethyl triester ( $C_{10}H_{15}NO_6$ ).

To a mixture of freshly prepared amine **M-2** (Scheme M where stereochemistry is (*2R-trans*)) (14 mmol) in  $CH_2Cl_2$  (20 mL) under  $N_2$  at 0 °C is added  $Et_3N$  (3.0 mL, 22 mmol), followed by the dropwise addition of  $ClCO_2Et$  (1.5 mL, 18 mmol). ## Preparation 75.

The aminoester product of preparation 75 is useful as a synthetic intermediate (for example, reagent A-4 of Scheme A).

To a cold (0-5°C) solution of anhydrous methanolic HCl was added 100 g of L-4-nitrophenylalanine (Advanced ChemTech) portionwise over 15 min. The mechanically stirred mixture was heated to gentle reflux for 48 h. The mixture was allowed to cool and then filtered through a sintered glass filter funnel, washing the collected solids with hot MeOH until only insoluble residues remained. The filtrate was concentrated *in vacuo* to afford the methyl ester (120 g) as waxy off white solid which was used without further purification.

To a suspension of methyl ester described above (87 g, 0.33 mole) in CH<sub>2</sub>Cl<sub>2</sub> (1500 mL) at ambient temperature was added di-*t*-butyldicarbonate (109 g, 0.50 mole) followed by the dropwise addition of Et<sub>3</sub>N (51 mL, 0.37 mole). After 15 min additional Et<sub>3</sub>N (40 mL, 0.29 mol) was added to maintain a slightly basic mixture (*ca.* pH 8). The reaction mixture was stirred 18 h and additional CH<sub>2</sub>Cl<sub>2</sub> (1400 mL) and Et<sub>3</sub>N (15 mL, 0.11 mol) were added. After an additional 2 h the reaction mixture was quenched by the slow addition of MeOH (100 mL), stirred for 1 h and then partitioned between CH<sub>2</sub>Cl<sub>2</sub> and cold 10% aqueous KHSO<sub>4</sub>. The organic layer was washed with saturated NaHCO<sub>3</sub> and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated *in vacuo*. Flash chromatography of the residue using hexane and a gradient of a 1:1 mixture of EtOAc/CH<sub>2</sub>Cl<sub>2</sub> (25-33%) afforded the Boc-methyl ester (69 g) as a white solid. Physical properties as follows: <sup>1</sup>H NMR (300 MHz; CDCl<sub>3</sub>) δ 8.16 (2H), 7.31 (2H), 5.04 (1H), 4.63 (1H), 3.73 (3H), 3.18 (2H), 1.41 (9H); MS (ES+) for C<sub>15</sub>H<sub>20</sub>N<sub>2</sub>O<sub>6</sub> *m/z* 325.2 (M+H)<sup>+</sup>.

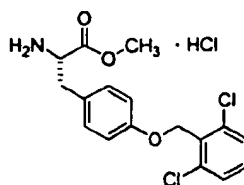

Palladium on carbon (10% w/w, 1.25 g) was added to a Parr hydrogenation flask under a N<sub>2</sub> atmosphere and carefully wetted with 100 mL of MeOH/THF (1:1). A solution of the Boc-methyl ester described above (25 g, 77 mmol) in 400 mL of MeOH/THF (1:1) was added and the mixture shaken on a hydrogenation apparatus under a hydrogen atmosphere (20 psi) for 1 h at ambient temperature. The reaction mixture was filtered through a pad of Celite and the solids washed several times with MeOH. The combined filtrates were concentrated *in vacuo* to afford the 4-aminophenylalanyl derivative (22.7 g) which was used without further purification. The reaction mixture was allowed to warm to temperature and stir an additional 18 h. The mixture was diluted with EtOAc (2 L) and then washed with 1N HCl, H<sub>2</sub>O, 1N NaOH and brine. The organic extract was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to give the crude product as a pale yellow solid. ## Preparation 77

**Intermediate-1:** Attachment of N-tert-butoxycarbonyl-[4-(2,6-dichlorobenzoylamino)]-L-phenylalanine to Merrifield resin was done using Horiki's method (Horiki et al., *Chem. Lett.* 1978(2) 165-168). In a 250 mL round bottom flask fitted with a drying tube, Merrifield resin (Biorad, 10.0 g, 13.5 mmol/g) and anhydrous potassium fluoride (Aldrich, 1.57g, 27.0 mmol) were added to a solution of N-tert-butoxycarbonyl-[4-(2,6-dichlorobenzoylamino)]-L-phenylalanine (Bachem California, 6.13 g, 13.5 mmol) in dry DMF (100 mL). The reaction mixture was stirred at 80°C in an oil bath for 24 hr. The cooled resin was then filtered and washed thoroughly with DMF (2 x 250 mL), 50% aqueous DMF (3 x 250 mL), methanol (3 x 250 mL), dichloromethane (3 x 250 mL), and finally methanol (3 x 250 mL). The resin was then dried under reduced pressure to constant weight to give Intermediate-1. Incorporation of N-tert-butoxycarbonyl-[4-(2,6-dichlorobenzoylamino)]-L-phenylalanine onto the resin was estimated to be 0.045 mmol/g from the increase in resin mass.

**Example 171:** The **Intermediate-1** (0.15 g, 0.1065 mmol/g) was pretreated with CH<sub>2</sub>Cl<sub>2</sub> (2x 3 mL). The swollen resin was then deprotected with 50% TFA/CH<sub>2</sub>Cl<sub>2</sub> (3mL, 30min). The resin was rinsed in the following order: CH<sub>2</sub>Cl<sub>2</sub> (2 x 3 mL), CH<sub>3</sub>OH (2 x 3 mL), CH<sub>2</sub>Cl<sub>2</sub> (2 x 3 mL). The resin was swollen with DMF (2 x 3 mL). 2-(3,4-

methylenedioxyphenyl)-1-methyl-5-oxo-3-pyrrolidine carboxylic acid (84 mg, 0.32 mmol) in DMF (1.0 mL) was activated with 0.5 M HBTU/HOBT in DMF (0.7 mL) and DIEA (0.139 mL, 0.799 mmol), and then added to the swollen resin. The mixture was vortexed for 2 hr at room temperature. The resin was filtered and washed in the following order:

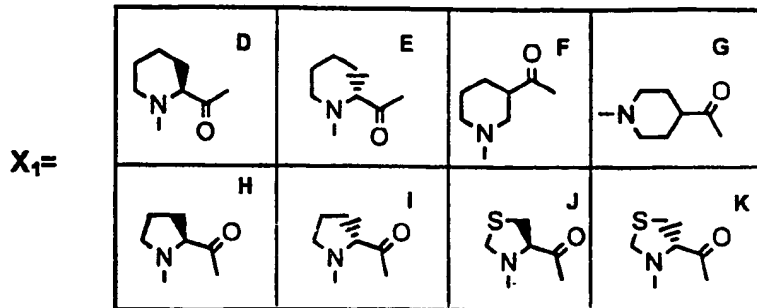

5 DMF(2 x 3 mL), CH<sub>2</sub>Cl<sub>2</sub> (2 x 3 mL), CH<sub>3</sub>OH (2 x 3 mL), CH<sub>2</sub>Cl<sub>2</sub> (2 x 3 mL), respectively. If a Kaiser test on a small quantity of the resin is positive (blue) then repeat the coupling procedure until a negative result is obtained. The resulting resin was then dried *in vacuo* to constant weight. The resin was placed in the polypropylene column and pretreated with 3 mL of THF. Then to the preswollen resin 1.6 mL of THF, 0.48 mL of

10 CH<sub>3</sub>OH, and 0.160 mL of 2N LiOH were added. The mixture was vortexed for 15 min and filtered to a clean and preweighed test tube. The resin was next washed with 2mL of THF/5% CH<sub>3</sub>OH (2x) and the combined filtrates were evaporated. The resulting gum was dissolved in 1 mL of water. The solution was then acidified with 1N HCl to pH 2.0. The precipitate was centrifuged, washed with water (5mL, 2x) and dried *in vacuo* to furnish

The resin was swollen with DMF (2 x 3 mL). N-Tert-butoxycarbonyl-nipecotic acid (103 mg, 0.45 mmol) in DMF (1.0 mL) was activated with 0.5 M HBTU/HOBT in DMF (0.910 mL) and DIEA (0.195 mL), then added to the swollen resin. The mixture was vortexed for 2 hr at room temperature. The resin was washed in the following order: DMF (2 x 3 mL),  $\text{CH}_2\text{Cl}_2$  (2 x 3 mL),  $\text{CH}_3\text{OH}$  (2 x 3 mL),  $\text{CH}_2\text{Cl}_2$  (2 x 3 mL) and dried (**Intermediate-2F**). If a Kaiser test on a small quantity of the resin is positive (blue) then repeat the coupling procedure until a negative result is obtained. The intermediate resins Intermediate-2D, 2E, 2G, 2H, 2I, 2J & 2K were each produced following this procedure.

If a Kaiser test (Kaiser et al., *Anal. Biochem.* 1970, 34, 594-598) on a small quantity of the resin is positive (blue) then repeat the coupling procedure until a negative result is obtained. The resulting resin was then dried *in vacuo* to constant weight (2.2 g). The resin was treated with 25 mL of liquid HF by stirring for 60 min at 0°C in an HF-reaction apparatus (Peninsula Laboratories Inc., Belmont, CA). ## Example 267

5-[[[(1S)-1-Carboxy-2-[4-[(2,6-dichlorobenzoyl)amino]phenyl]ethyl]amino]carbonyl]-tetrahydro- $\gamma$ -oxo-1,4-thiazepine-4(5*H*)-butanoic acid

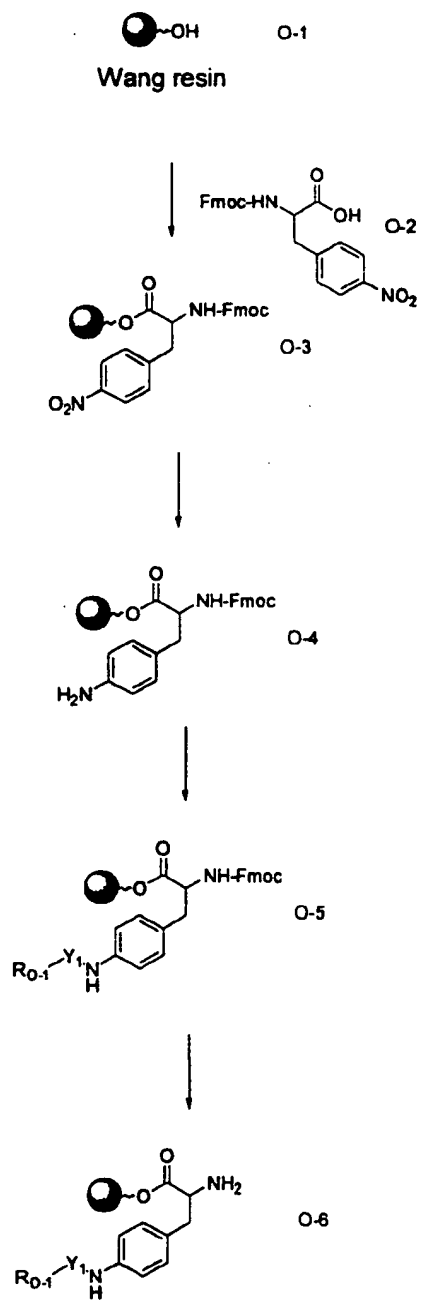

- 5 The **Intermediate-1** (0.3g, 0.195mmol/g) was pretreated with  $\text{CH}_2\text{Cl}_2$  (2x 3 mL). The swollen resin was then deprotected with 50% TFA/ $\text{CH}_2\text{Cl}_2$  (3mL, 30 min). The resin was rinsed in the following order:  $\text{CH}_2\text{Cl}_2$  (2x 3 mL),  $\text{CH}_3\text{OH}$  (2x 3mL),  $\text{CH}_2\text{Cl}_2$ (2x 3mL). The resin was swollen with DMF (2x 3mL). N-Tert-butoxycarbonyl-1,4-thiazoline-5-carboxylic acid (204 mg, 0.78 mmol) in DMF (2.0 mL) was activated with 0.5 M
- 10 HBTU/HOBT in DMF (1.6 mL) and DIEA (0.340 mL, 1.95 mmol), then added to the swollen resin. The mixture was vortexed for 2 hr at room temperature. The resin was filtered and washed in the following order: DMF (2x 3 mL),  $\text{CH}_2\text{Cl}_2$  (2x 3mL),  $\text{CH}_3\text{OH}$  (2x 3mL),  $\text{CH}_2\text{Cl}_2$ (2x 3mL), respectively. If a Kaiser test on a small quantity of the resin is positive (blue) then repeat the coupling procedure until a negative result is obtained. The
- 15 resin (intermediate-3, 0.2 g, 0.13mmol/g) was pretreated with  $\text{CH}_2\text{Cl}_2$  (2x 3 mL). The swollen resin was then deprotected with 50% TFA/ $\text{CH}_2\text{Cl}_2$  (3mL, 30 min). The resin was rinsed in the following order:  $\text{CH}_2\text{Cl}_2$  (2x 3mL),  $\text{CH}_3\text{OH}$  (2x 3mL),  $\text{CH}_2\text{Cl}_2$  (2x 3mL). The resin was then swollen with DMF (3mL). Succinic anhydride (78 mg, 0.78 mmol)

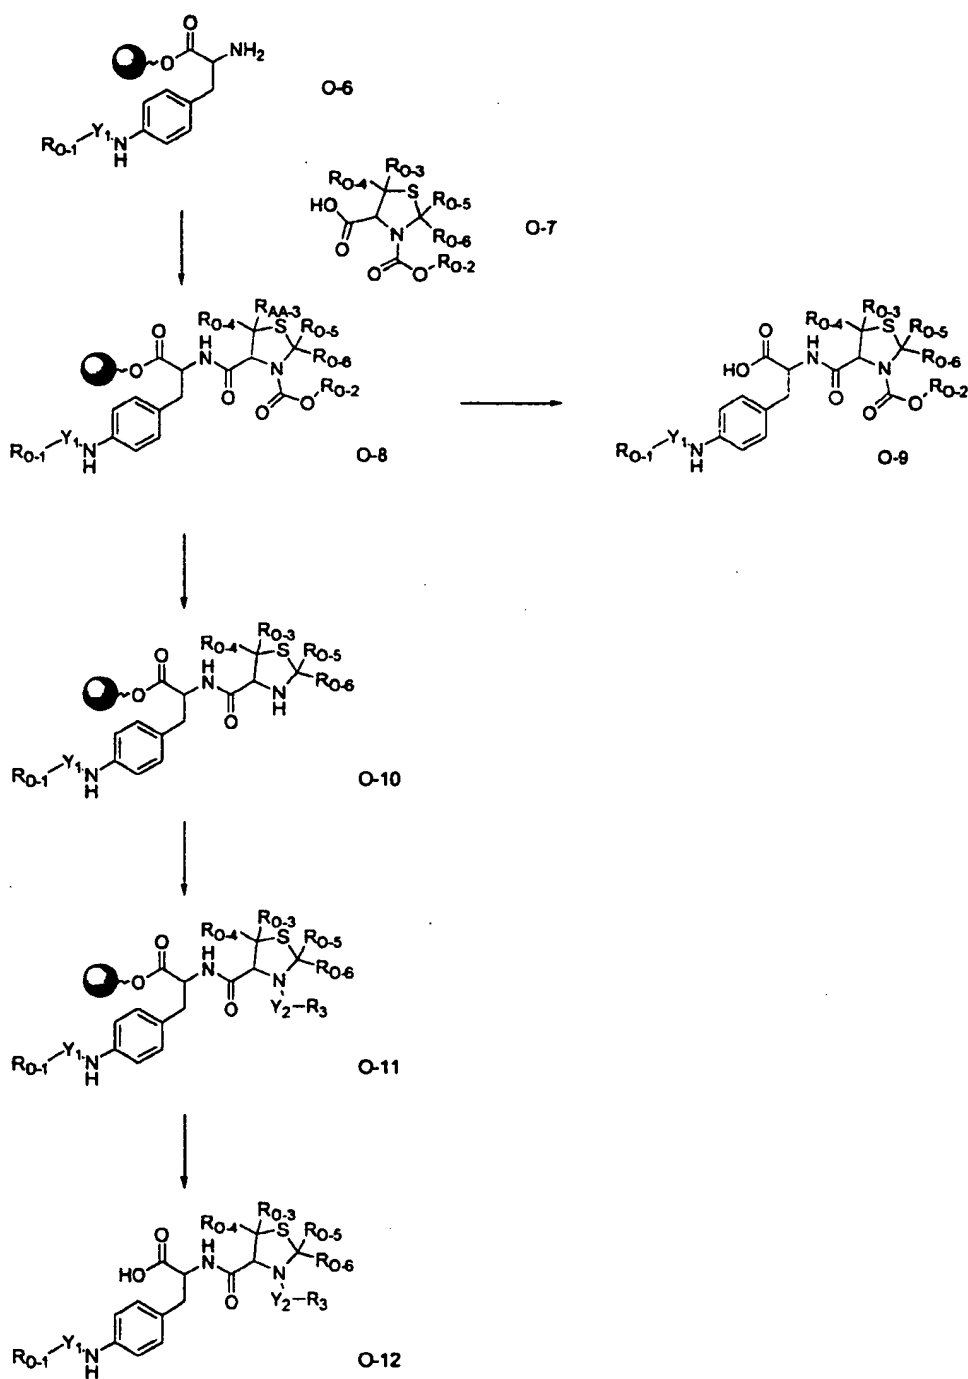

dissolved in DMF (4mL) was added to the swollen resin and stirred at 50°C for 2hr. Then the resin was filtered and washed in the following order: DMF (2x 3mL), CH<sub>2</sub>Cl<sub>2</sub> (2x 3mL), CH<sub>3</sub>OH (2x 3mL), CH<sub>2</sub>Cl<sub>2</sub> (2x 3mL) respectively. If a Kaiser test on a small quantity of the resin is positive (blue) then repeat the coupling procedure until a negative result is obtained. The resulting resin was then dried in vacuo to constant weight. The resin was placed in the polypropylene column and pretreated with THF (3 mL). Then THF (3.9 mL), CH<sub>3</sub>OH (1.2 mL) and 2N LiOH (0.195 mL) were added to the swollen resin. The mixture was vortexed for 15 min and filtered to a clean and preweighed test tube. The resin was next washed with THF/5% CH<sub>3</sub>OH (2x 2mL) and the combined filtrates were evaporated. The resulting gum was dissolved in H<sub>2</sub>O (1 mL). The solution was then acidified with 1N HCl to pH 2.0. The precipitate was centrifuged, washed with H<sub>2</sub>O (2 x 5mL) and dried in vacuo to furnish 80 mg of Example 267 as a solid: ESMS (m/z) 594([M-H]<sup>-</sup>).

## Scheme O

## Scheme O (continued)

Where:  $R_{O-1}$  is defined as  $R_{12}$ ;  $R_{O-2}$  is defined as  $C_{1-6}$  alkyl or  $C_{7-17}$  arylalkyl;  $R_{O-3}$ ,  $R_{O-4}$ , and  $R_{O-5}$ , are defined independently as  $R_1$ .  $R_{O-6}$  is defined as  $R_2$ .  $Y_1$  and  $Y_2$  are defined independently as  $Y$ .

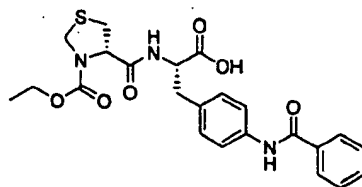

- 5            Scheme O describes a method for the preparation of examples of the formula **O-9** and **O-12**. Commercially available Wang resin (**O-1**) is acylated with commercially available *N*- $\alpha$ -Fmoc-Phe(NO<sub>2</sub>)-OH (**O-2**) under standard conditions to afford the resin of formula **O-3**. Reduction of the aromatic nitro group (Meyer *et al.*, *Mol. Diversity* **1995**, *1*, 13-20) affords the resin bound aniline (**O-4**) which may be reacted with a variety of
- 10        electrophilic reagents to afford resin bound amides (**O-5** where  $Y_1$  is C(=O)), ureas (**O-5** where  $Y_1$  is C(=O)NH), sulfonamides (**O-5** where  $Y_1$  is SO<sub>2</sub>), and carbamates (**O-5** where  $Y_1$  is C(=O)O). Removal of the Fmoc group under standard conditions provides amine of general structure **O-6** which is acylated using standard solid-phase peptide synthesis conditions (Atherton, E.; Sheppard R.C. *Solid Phase Peptide Synthesis: A Practical*
- 15        *Approach*; IRL Press at Oxford University Press: Oxford, 1989) with a commercially available or readily prepared thiazolidine-4-carboxylic acid of general formula **O-7** to afford the resin bound intermediate **O-8**. Mild cleavage under standard conditions (Atherton, E.; Sheppard R.C. *Solid Phase Peptide Synthesis: A Practical Approach*; IRL Press at Oxford University Press: Oxford, 1989) affords the acid of general structure **O-9**.
- 20        In those cases where  $R_{O-2}$  is a 9-fluorenylmethyl group, standard Fmoc group removal affords the amine of general structure **O-10**, which may be reacted with a variety of electrophilic reagents as described in Scheme A to afford resin bound amides, ureas, sulfonamides and carbamates of general structure **O-11**. Mild cleavage under standard conditions affords the acid of general structure **O-12**.

Preparation 79 and Example 268.

(4*S*)-4-[[[(1*S*)-1-Carboxy-2-[4-[(benzoyl)amino]phenyl]ethyl]amino]carbonyl]-3-thiazolidinecarboxylic acid 3-ethyl ester

-217-

To a mixture of Wang resin (1% DVB, Advanced Chemtech, 2.75 g, 2.20 mmol based on manufacture's loading of 0.8 mmol/g resin) in DMF (12 mL) was added *N*- $\alpha$ -Fmoc-Phe(NO<sub>2</sub>)-OH, **O-2** (Advanced Chemtech, 1.90 g, 4.40 mmol) at room temperature.

5 After mixing for 10 min (by passing a slow stream of nitrogen through the mixture) pyridine (587  $\mu$ L, 7.26 mmol) and 2,6-dichlorobenzoyl chloride (630  $\mu$ L, 4.40 mmol) were added. The mixture was agitated overnight via nitrogen bubbling, filtered, washed with DMF, methylene chloride and methanol and dried *in vacuo*. In order to cap any unreacted hydroxymethyl groups, the resin was suspended in dichloroethane (5 mL) and to this  
10 mixture was added benzoyl chloride (0.75 mL) and pyridine (0.75 mL). The mixture was agitated for 2 h, filtered, washed with DMF, methylene chloride, methanol, methylene chloride and methanol, and dried *in vacuo* to afford the resin **O-3** (3.30 g). IR (diamond anvil) 1733, 1606 (resin), 1520 (resin), 1494 (resin), 1452 (resin), 1347, 1247, 1174, 1029 cm<sup>-1</sup>.

15 To the prewashed (2 X 20 mL DMF) resin **O-3** (1.0 g, ca. 0.6 mmol based on an adjusted loading of 0.6 mmol/g) was added SnCl<sub>2</sub>• 2 H<sub>2</sub>O (6 mL of a 2M solution in DMF, 12 mmol). The viscous suspension was agitated for 4 hours by nitrogen bubbling, filtered and washed with DMF (2 X 20 mL). The resin was resuspended with SnCl<sub>2</sub>• 2 H<sub>2</sub>O (6 mL of a 2M solution in DMF, 12 mmol), agitated overnight via nitrogen bubbling, filtered,  
20 washed extensively with DMF, water, 2-propanol, methylene chloride and methanol and dried *in vacuo* to afford the resin **O-4**. Examination of the FTIR spectra of a small sample of resin **O-4** failed to exhibit an absorption at 1347 cm<sup>-1</sup>.

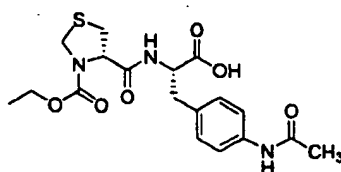

To a mixture of prewashed (2 X 20 mL CH<sub>2</sub>Cl<sub>2</sub>) resin **O-4** (0.30 g, ca. 0.18 mmol based on an adjusted loading of 0.6 mmol/g) in 1,2-dichloroethane (3 mL) was added  
25 benzoyl chloride (174  $\mu$ L, 1.50 mmol) and DIEA (313  $\mu$ L, 1.80 mmol). The mixture was agitated overnight via nitrogen bubbling, filtered, washed with methylene chloride, DMF, methanol, and methylene chloride and dried *in vacuo* to afford resin **O-5**. To a mixture of

resin **O-5** in methylene chloride (5 mL) was added a solution of piperidine in DMF (30%, 5 mL). A slow stream of nitrogen was bubbled through the mixture to effect mixing for 20 min. The resin was filtered, washed with DMF and resuspended in a solution of piperidine in DMF (30%, 10 mL). After gentle mixing for 40 min, the resin was filtered and washed with DMF, methylene chloride, methanol and methylene chloride and diluted with DMF (40 mL). To this mixture was added *N*-ethoxycarbonyl-D-thiazolidine-4-carboxylic acid (**O-7**, 0.15 g, 0.72 mmol), HOBt (0.11 g, 0.72 mmol), PyBOP (0.37 g, 0.72 mmol) and DIEA (313  $\mu$ L, 1.80 mmol). The reaction was mixed for 4 h at which point the qualitative Kaiser test was negative. The resin was filtered and washed with DMF, methylene chloride and MeOH and dried *in vacuo* to afford resin **O-8**. After swelling with a minimum of methylene chloride (ca. 0.5 mL), the resin **O-8** was suspended with 95 % aqueous TFA (5 mL). The mixture was mixed by magnetic stirring for 1h, filtered and washed with TFA (2 X 3 mL) and methylene chloride. The combined filtrates were evaporated *in vacuo* to afford a residue that was purified by flash chromatography using methylene chloride/methanol (2%) containing glacial acetic acid (0.1%) as eluant to afford the title compound (80 mg). Lyophilization from glacial acetic acid afforded an amorphous powder: IR (drift) 3311, 3298, 1670, 1601, 1579, 1531, 1487, 1412, 1380, 1345, 1324, 1265, 1205, 1190, 709  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR (300 MHz, DMSO-*d*<sub>6</sub>)  $\delta$  10.39 (1 H), 8.39 (1 H), 8.14 (2 H), 7.86 (2 H), 7.74 (3 H), 7.36 (2 H), 4.83 (2 H), 4.59 (1 H), 4.48 (1 H), 4.22 (2 H), 3.48 (2 H), 3.26 (1 H), 3.06 (2 H), 1.35 (3 H);  $^{13}\text{C}$  NMR (75 MHz, DMSO-*d*<sub>6</sub>)  $\delta$  173.4, 169.8, 165.8, 154.0, 138.0, 135.4, 133.3, 131.9, 129.8, 128.8, 128.0, 120.4, 61.8, 54.2, 48.8, 36.7, 14.8; MS (ESI+) for  $\text{C}_{23}\text{H}_{25}\text{N}_3\text{O}_6\text{S}$   $m/z$  472.0 ( $\text{M}+\text{H}^+$ ); MS (ESI-) for  $\text{C}_{23}\text{H}_{25}\text{N}_3\text{O}_6\text{S}$   $m/z$  470.1 ( $\text{M}-\text{H}^-$ ); MS (FAB)  $m/z$  (rel. intensity) 472 ( $\text{MH}^+$ , 99), 472 (99), 371 (31), 160 (31), 81 (31), 71 (45), 69 (46), 57 (71), 55 (58), 43 (47), 41 (42); HRMS (FAB) calcd for  $\text{C}_{23}\text{H}_{25}\text{N}_3\text{O}_6\text{S} + \text{H}_1$  472.1542, found 472.1563; Anal. ## Scheme P

## Scheme P (continued)

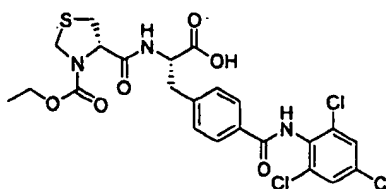

Where:  $R_{P,1}$  is defined as  $R_{12}$ ;  $R_{P,2}$  is defined as  $C_{1-6}$  alkyl or  $C_{7-17}$  arylalkyl;  $R_{P,3}$ ,  $R_{P,4}$ , and  $R_{P,5}$ , are defined independently as  $R_1$ .  $R_{P,6}$  is defined as  $R_2$ .

Scheme P describes a method for the preparation of examples of the formula **P-9** and **P-12**. Commercially available Wang resin (**P-1**) is acylated with commercially available *N*- $\alpha$ -Boc-Phe(I)-OH (**P-2**) under standard conditions to afford the resin of formula **P-3**. Carbonylation of the resin bound aryl iodide with carbon monoxide and an amine in the presence of a source of palladium(0) affords the resin bound amide of general formula **P-5** (for a general review of carbonylation chemistry, see: Colquhoun, H.M.; Thompson, D.J.; Twigg, M.V. *Carbonylation* Plenum Press: New York, 1991). Mild cleavage under standard conditions affords the amino acid of general structure **P-5** which is esterified under mild acid catalysis to afford the amino ester of general structure **P-6**. Condensation with a commercially available or readily prepared thiazolidine-4-carboxylic acid of general formula **P-7** under conditions described in Scheme A affords the pseudodipeptide of general structure **P-8**. Mild base hydrolysis of the ester of general structure **P-8** affords the acid of general structure **P-9**. In the case where  $R_{P,2}$  is a 9-fluorenylmethyl group, standard Fmoc group removal (Atherton, E.; Sheppard R.C. *Solid Phase Peptide Synthesis: A Practical Approach*; IRL Press at Oxford University Press: Oxford, 1989) affords the amine of general structure **P-10**, which may be reacted with a variety of electrophilic reagents as described in Scheme A to afford amides, ureas, sulfonamides and carbamates of general structure **P-11**. Mild base hydrolysis of the ester in general structure **P-11** affords the acid of general structure **P-12**.

To a cooled (0-50C) mixture of Wang polystyrene resin **P-1** (Advanced Chemtech, 2.0 g, ca. 1.5 mmol), *N*-Boc-4-iodo-L-phenylalanine **P-2** (Bachem, 4.00 g, 10 mmol), and  $\text{PPh}_3$  (1.30 g, 5.0 mmol) in THF (20 mL) was added diethyl azodicarboxylate (0.80 mL, 5.0 mmol) in 4 approximately equal portions at 5 min intervals. When the orange color had discharged, the mixture was warmed to ambient temperature and stirred for 5 h. The mixture was diluted with THF (30 mL) and filtered. The resin was washed with DMF, THF and MeOH and dried *in vacuo* to afford the esterified resin **P-3** (2.68 g) as a colorless powder:  $^{13}\text{C}$  NMR (100 MHz,  $\text{CD}_2\text{Cl}_2$ , 4 mm MAS probe)  $\delta$  171.86, 155.33, 137.85, 136.40, 131.87, 128.00, 92.74, 80.09, 54.05, 38.05, 28.51.

$\text{N}_2$  was bubbled through a mixture of *N*-Boc-4-iodo-L-phenylalanine functionalized Wang resin **P-3** (500 mg, ca. 0.3 mmol),  $\text{PPh}_3$  (0.21 g, 0.8 mmol), 2,4,6-trichloroaniline (0.98 g, 5.0 mmol) and DIEA (3.48 mL, 20 mmol) in NMP (20 mL) for 10 min.  $\text{Pd}_2\text{dba}_3$  (0.18 g, 0.2 mmol) was added and the reaction mixture was placed under a CO atmosphere and heated (bath temp. 70 °C) for 18 h. Upon cooling to ambient temperature, the mixture was diluted with 3% (w/v) sodium diethyldithiocarbamate in 95:5 NMP:DIEA (10 mL). After an additional 10 min, the mixture was filtered and the resin washed with NMP, THF and MeOH and dried *in vacuo* to afford the functionalized resin **P-4** as a colorless powder.

Resin **P-4** was swollen with methylene chloride (0.5 mL) and diluted with 95:5 TFA: $\text{H}_2\text{O}$  (10 mL). After 90 min the mixture was filtered and the resin washed with TFA (3 x 5 mL) and  $\text{CH}_2\text{Cl}_2$ . The combined filtrates were concentrated *in vacuo* and the residue lyophilized from glacial acetic acid to provide the amino acid **P-5** (152 mg) as a powder which was used without purification. ## Scheme Q

$R_{Q-1}$  and  $R_{Q-2}$  are defined independently as  $R_1$ .  $R_{Q-3}$  is defined as  $C_{1-6}$  alkyl or  $C_{7-17}$  arylalkyl.  $R_{Q-4}$  is defined as oxygen or N- $R_{11}$ .  $R_{Q-5}$  is defined as a suitable protecting group for a nitrogen (such as Boc or Fmoc) or oxygen (such as t-butyldimethylsilyl) (Greene, T.W.; Wuts, P.G.M.. *Protective Groups in Organic Synthesis*, John Wiley and Sons, New York, 1991).

Scheme Q describes a general method for the preparation of examples of the formula Q-7. A commercially available or readily prepared sulfur containing amino acid of structure Q-1 is condensed with a suitably protected aldehyde to afford the thiazolidine-4-carboxylic acid of general formula Q-2. Standard deprotection (Greene, T.W.; Wuts, P.G.M.. *Protective Groups in Organic Synthesis*, John Wiley and Sons, New York, 1991) affords intermediate Q-3 which is readily cyclized to the bicycle Q-4 using 1,1'-carbonyldiimidazole or phosgene or a suitable equivalent. For the preparation of bicycles of general structure Q-4 in which Z is  $CH_2$ , see as examples: (a) Aszodi, J.; Bonnet, A.; Teutsch, G. *Tetrahedron* **1990**, *46*, 1579. (b) Baldwin, J.E.; Lee, V.; Schofield, C.J. *Heterocycles* **1992**, *34*, 903. (c) Genin, M.J.; Johnson, R.L. *J. Am. Chem. Soc.* **1992**, *114*, 8778. (d) Siddiqui, M.A.; Preville, P.; Tarazi, M.; Warder, S.E.; Eby, P.; Gorseth, E.; Puumala, K.; DiMaio, J. *Tetrahedron Lett.* **1997**, *38*, 8807. (e) Subasinghe, M.L.; Bontems, R.J.; McIntee, E.; Mishra, R.K.; Johnson, R.L. *J. Med. Chem.* **1993**, *36*, 2356. Removal of the ester protecting group affords the acid of general structure Q-5 which is condensed with amino acyl derivative Q-6 under standard peptide synthesis conditions to provide Q-7 (for a review of procedures of peptide synthesis see: Bodansky, M.; Bodansky, A. *The Practice of Peptide Synthesis*; Springer-Verlag: Berlin, 1984). Mild base hydrolysis of the ester of general structure Q-7 provides acid Q-8.

Scheme R.

## Scheme R

Scheme R teaches a general method for the preparation of Examples corresponding to structures R-4 and R-5, where R<sub>6</sub> is nitrogen. Thus reaction of the amide R-1 (obtained from the imide J-2), with the organozinc derived from a suitable protected β-iodoalanine, provides the acylamino azaphenylalanine R-2. N-deprotection of R-2 gives the aminoester R-3, that is used (as exemplified by reagent A-4 of Scheme A, and by reagent B-5 of Scheme B) for the synthesis of Examples R-4 and R-5 of this invention.

## Preparation 87

(Scheme R: R-1 where R<sub>6</sub> is N, R<sub>7</sub> is H, R<sub>8</sub> is -NHC(O)-, and R<sub>9</sub> is 2,6-dichloro) **2,6-Dichloro-N-(5-iodo-2-pyridinyl)benzamide** (C<sub>12</sub>H<sub>7</sub>Cl<sub>2</sub>IN<sub>2</sub>O). A mixture of J-2 and NH<sub>2</sub>NH<sub>2</sub>·H<sub>2</sub>O in MeOH is refluxed for 6 h under Ar. The reaction mixture is cooled, and the MeOH is removed *in vacuo*. The residue is partitioned between H<sub>2</sub>O and EtOAc.

The EtOAc extracts are dried, filtered and concentrated to give a brown-colored solid, that is purified by silica flash chromatography (99:1 toluene/EtOAc) to provide **Preparation 87**: TLC (98:2 toluene/EtOAc) R<sub>f</sub> = 0.43; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 10.23 (1H), 8.26 (1H), 7.99 (1H), 7.57 (1H), 7.41–7.31 (3H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 75 MHz) δ 163.40, 153.22, 150.95, 147.16, 135.83, 132.72, 131.90, 130.34, 128.65, 128.50, 117.09, 86.55; MS (ESI) 393, 391.

To an amberized flask containing activated Zn dust (0.0802 g, 12.27 mmol) under Ar is added dry THF (6 mL) and 1,2-dibromoethane (0.045 mL). This suspension is brought briefly to a gentle reflux, and then is cooled to rt. A solution of TMSCl (1 M in THF, 0.39 mL) is added. The reaction mixture is stirred at 45 ± 5 °C for 30 min, and then is cooled to rt. To this mixture is added

a degassed solution of *N*-[(1,1-dimethylethoxy)carbonyl]-3-iodo-L-alanine methyl ester (4.04 g, 12.27 mmol) in 2:1 *N,N*-dimethylacetamide/THF (18 mL). The reaction mixture is stirred at  $45 \pm 5$  °C for 5 h, and then is cooled to 0 °C. To this mixture is added  $\text{PdCl}_2(\text{PPh}_3)_2$  (0.428 g) followed immediately by a degassed solution of **Preparation 87** in 1:1 *N,N*-dimethylacetamide/THF (19 mL). This reaction mixture is stirred at  $45 \pm 5$  °C for 44 h. It is cooled to 0 °C, and is quenched with cold aqueous satd  $\text{NH}_4\text{Cl}$ . This mixture is extracted with EtOAc. The combined EtOAc extracts are washed with aqueous satd  $\text{NH}_4\text{Cl}$  and brine. The EtOAc extracts are dried, filtered and concentrated to provide a green-brown colored oil, that is purified by silica flash chromatography (steps of 750:250:1, 700:300:1 and 650:350:1 heptane/EtOAc/*i*PrOH) to provide **Preparation 88**: TLC  $R_f$ = 0.28 (7:3 hexanes/EtOAc).

Biological AssaysJurkat-Endothelial Cell Adhesion Assay:

The following assay established the activity of the present compounds in inhibiting  $\beta_1$ -mediated cell adhesion in a representative *in vitro* system. This assay measures the adhesive interactions of a T-cell line, Jurkat, known to express the  $\alpha_4\beta_1$  integrin, to endothelial monolayers in the presence of test compounds. The test compounds were added in increasing concentrations to T-cells and then the T-cell compound mixture was added to IL-1 stimulated endothelial cell monolayers. The plates were incubated, washed and the percentage of attached cells was quantitated. The present assay directly demonstrates the cell adhesion inhibitory activity and adhesion modulatory activity of the compounds.

Human umbilical vein endothelial cells were purchased from Clonetics (San Diego, CA.) at passage number 2. The cells were grown on 0.5% porcine skin gelatin pre-coated flasks (Sigma, St. Louis MO.) in EGM-UV media (Clonetics, San Diego, CA) supplemented with 10% fetal bovine serum. Cells are refed every 2-3 days reaching confluence by day 4 to 6. The cells are monitored for factor VIII antigen and results show that at passage 12, the cells are positive for this antigen. The endothelial cells are not used following passage 6.

The T-cell line Jurkat was obtained from American Type Tissue Culture Collection (Rockville, MD) and the cells were cultured in RPMI containing 10 % fetal calf serum. The cells were washed twice in Hank's Balanced Salt Solution (HBSS) and resuspended in Dulbecco's Minimal Eagle's Media (DMEM) containing 2.5 mg/ml Human Serum Albumin (HSA). Jurkat cells ( $1 \times 10^6$  cells/ml) were stained with 10 ng/ml BCECF-AM (Molecular Probes, Eugene, OR) in HBSS without phenol red. The cells were loaded with BCECF for 60 minutes in the dark at 37°C, washed 2 times, and resuspended in DMEM-HSA solution.

Confluent endothelial monolayers, grown in 96-well tissue culture plates, were stimulated for 4 hr. at 37 °C with 0.1 ng/ml (~50 U/ml) recombinant IL-1 (Amgen, Thousand Oaks, CA). Following this incubation, the monolayers were washed twice with HBSS and 0.1 ml of DMEM-HSA solution was added. Jurkat

cells ( $5 \times 10^5$  cells) were combined with the appropriate concentration of the test compound and 0.1 ml of the Jurkat cell-compound mixture was added to the endothelial cell monolayers. Generally, 100, 20, 5 and 1.25  $\mu$ M compound concentrations were tested. These concentrations are adjusted downward for  
5 analogs found or thought to be more potent. The plates were placed on ice for 5 minutes to allow for Jurkat cell settling and the plates were incubated at 37 °C for 20 minutes. Following this incubation, the monolayers were washed twice with PBS containing 1 mM calcium chloride and 1 mM magnesium chloride and the plates were read using a Millipore Cytofluor 2300 (Marlboro, MA.). Fluorescence  
10 in each well was measured as Arbitrary Fluorescence Units and percent adhesion in the absence of compound was adjusted to 100% and the % adhesion in the presence of compound was calculated. Monolayers were also fixed in 3% paraformaldehyde and evaluated microscopically to verify the adhesion. This procedure is a modification of a previously published method (Cardarelli et al., *J. Biol. Chem.* 269:18668-18673 (1994)).

#### Jurkat-CS-1 assay

The CS-1 derived peptide, CLHPGEILDVPST, and the scrambled control peptide, CLHGPIELVSDPT, were synthesized on a Beckman 990 synthesizer  
20 using t-Boc methodology. The peptides were immobilized onto microtiter plates using the heterobifunctional crosslinker 3-(2-pyridyldithio)propionic acid N-hydroxysuccinimide ester (SPDP) as reported by Pierschbacher et al., *Proc. Natl. Acad. USA*, 80:1224-1227 (1983). Microtiter plates were coated with 20  $\mu$ g/ml HSA for 2 hr. at room temperature, washed once with PBS and derivatized with 10  
25  $\mu$ g/ml SPDP for 1 hr. After washing, 100  $\mu$ l of a 100  $\mu$ g/ml cysteine containing peptide solution which had been recently dissolved was added to the wells and allowed to crosslink to the plates overnight at 4 °C. Unbound peptide was removed from plates by washing with PBS. To block non-reacted sites, the plates are coated with 100  $\mu$ l of a 2.5 mg/ml BSA solution in PBS for 1 hr. at 37 °C. 100  $\mu$ l of  
30 Jurkat cells ( $2.5 \times 10^6$  cells/ml) in DMEM plus BSA (2.5 mg/ml) was mixed with

an appropriate concentration of the compound to be tested and the mixture was added to peptide coated dishes and incubated for 1 hr. at 37 °C. Generally 100, 20, 5 and 1.25  $\mu$ M concentrations of the compound were tested. The concentrations of the compound were adjusted downward for compounds thought or found to be more potent.

Following this incubation the plates were washed once with PBS and the attached cells were fixed with 3% paraformaldehyde in PBS and stained with 0.5% toluidine blue in 3.7% formaldehyde. The cells were stained overnight at room temperature and the optical density at 590 nm of toluidine blue stained cells was determined using a vertical pathway spectrophotometer to quantitate attachment (VMAX Kinetic Microplate Reader, Molecular Devices, Menlo Park, CA). This procedure is a modification of a previously published method (Cardarelli et al, J. Biol. Chem., 269:18668-18673 (1994) and Cardarelli et al, Proc. Natl. Acad. Sci. USA, 83:2647-2651 (1986)).

The preferred compounds are those which have low  $IC_{50}$  values in the Jurkat EC assay or the Jurkat-CS-1 assay described above or which have at least moderate activity in both assays. All of the compounds of the present invention have an activity of less than 50  $\mu$ M in the Jurkat CS-1 assay or less than 500  $\mu$ M in the Jurkat EC assay. Compounds with activity in the Jurkat CS-1 assay preferably have  $IC_{50}$  values of less than 1  $\mu$ M, more preferably less than 0.5  $\mu$ M, most preferably less than or equal to 0.08  $\mu$ M. Compounds with activity in the Jurkat EC assay preferably have  $IC_{50}$  values of less than 10  $\mu$ M, more preferably less than 5  $\mu$ M, most preferably less than or equal to 0.8  $\mu$ M.

In the Jurkat EC Assay,  $IC_{50}$  value ranges ( $\mu$ M) are depicted by A, B, and C and in the Jurkat CS-1 Assay,  $IC_{50}$  value ranges are depicted by D, E, and F. These ranges are as follows:

*In vitro* data:

EC:  $A \geq 1 \mu\text{M}$ ;  $1 \mu\text{M} > B > 0.25 \mu\text{M}$ ;  $C \leq 0.25 \mu\text{M}$

CS-1  $D \geq 0.75 \mu\text{M}$ ;  $0.75 \mu\text{M} > E > 0.05 \mu\text{M}$ ;  $F \leq 0.05 \mu\text{M}$ .

#### Biological Activity in Dextran Pleurisy Model

Certain compounds of the present invention were tested in a Dextran® pleurisy model.

#### 5 Rationale for Developing an $\alpha_4\beta_1$ Integrin Antagonist to Treat Inflammatory Diseases

- VLA-4, a member of the  $\beta_1$  integrin family of adhesion molecules, is thought to play a critical role in several types of inflammatory disease processes by promoting leukocyte adhesion to vascular cell adhesion molecule (VCAM-1) and the CS-1 domain of fibronectin in extracellular tissue matrix (Elices MJ, Osborn L, Takada Y, Crouse C, 10 Luhowskyj S, Hemler M, Lobb RR. VCAM-1 on activated endothelium interacts with the leukocyte integrin VLA-4 at a site distinct from the VLA-4-fibronectin binding site. Cell; 60: 577-584. 1990, Humphries MJ, Akiyama SK, Komoriya A, Olden K, Yamada KM.

- Identification of an alternatively-spliced site in human plasma fibronectin that mediates cell type-specific adhesion. Cell; 60: 53-61, 1990) Of the cell types expressing VLA-4, the major emphasis has been on eosinophils, lymphocytes, and monocytes. Validation of the role of VLA-4 has relied predominantly on the use of anti-VLA-4 antibodies which have been shown to suppress

Attenuation of colitis in the cotton-top Tamarin by anti-4 integrin monoclonal antibody. J Clin Invest; 92: 372-380, 1993). Since eosinophils represent a major component of the inflammatory cell influx in asthmatic lung tissue we developed a simple acute inflammatory model of VLA-4 integrin-dependent eosinophil infiltration which could be used to identify VLA-4 antagonists; such compounds would be of potential value in the treatment of asthma as well as other diseases in which VLA-4 played a role.

#### Materials and Methods

##### Animals, housing and viral testing:

C57BL/6 mice (Jackson, Bar Harbor, ME; ), 6-8 weeks old, weighing 20-25g were used throughout. All mice were acclimated for at least 7-14 days after arrival and maintained under controlled temperature (20-22°C) and a 12 hr daily light cycle (6.00 A.M. - 6.00 P.M.). Mice were housed in laminar flow racks and checked biweekly for viral infections (mouse hepatitis virus, minute virus of mice, rodent orphan parvovirus, Sendai) with kits obtained from Oreganon Teknika (Durham, NC) using established enzyme-linked immunoabsorbent assays. Mice testing positive for any of the above were omitted from the study. All mice were fed standard laboratory chow (Upjohn Lab Rodent Irradiated Mouse Chow, #5011-3, PMI Feeds, St. Louis, MO) and acidified drinking water (pH 5.0) ad libitum.

Induction of Inflammation by Intrapleural Injection of Dextran:

Intrapleural injections were made using a 27G needle cut to 3-4 mm and blunted by filing. Injections were made by inserting the needle between the mid-intercostal ribs on the right side of the thoracic cavity.

Dextran (MW 5-40x10<sup>6</sup>, St Louis, MO.) was injected as a 10% solution in saline in a volume of 100 µl/mouse. Care was taken to avoid bleeding at the site of injection at which the intercostal muscles were cut to facilitate smooth insertion of the needle.

Quantitation of Pleural Inflammatory Leukocyte Responses:

Pleural leukocytes were collected as follows: 4h post-induction, pleural inflammatory exudate was removed by washing with 2 x 1.0 ml Ca<sup>++</sup>/Mg<sup>++</sup> free HBSS (Gibco, Grand Island, NY) containing 45 mg EDTA/100 ml HBSS, 4°C. Total leukocyte counts were made by hemocytometer following erythrocyte lysis in 2% acetic acid in PBS buffer; exudate leukocyte pellets were resuspended in serum for cytopspin preparations and stained (Diff Quik, Baxter Healthcare, McGraw Park, IL) for differential leukocyte counts (neutrophils, eosinophils, and mononuclear leukocytes).

The pleural cavities of mice receiving either no intrapleural injection, or saline were washed and the cells counted in the same way to estimate baseline or saline-induced pleural leukocyte counts respectively.

Administration of compounds:

All drugs were dissolved in PBS and the pH adjusted to 7.5 with NaOH. Each compound was administered intravenously through the retroorbital sinus at hourly intervals (0-3h) starting from time "0" as indicated. Mice were carefully monitored for side effects; none were noted for the series of compounds reported herein.

The following compounds were tested for their inhibitory effects on dextran-induced leukocyte infiltration: Examples 3, 8, 9, 10, 12, 16, 37, 62, 66, 67, 99, 100, 111, 113, 115, 127, 131, 141, 184, 185, 192, PBS (saline) was administered iv. as a control.

Inhibition of eosinophil infiltration, which was suppressed by anti-alpha-4 Mab (PS/2, 50%), was used as a readout of VLA-4 antagonist activity of the compounds tested. Data for neutrophils are also reported.

Results:

- 5 Dextran pleural leukocyte response. The total pleural leukocyte counts were  $255 \times 10^4$  ( $\pm$  16 SEM) cells in the normal pleural cavity; of the normal pleural leukocyte population, all cells were mononuclear (a similar response was observed following intrapleural saline injection). Four hours after intrapleural injection of dextran total pleural leukocyte counts increased to  $719 \times 10^4$  ( $\pm$  67 SEM) and comprised  $36.8 \times 10^4$  ( $\pm$  4.1 SEM) eosinophils, 10  $292 \times 10^4$  ( $\pm$  25 SEM) neutrophils and  $391 \times 10^4$  ( $\pm$  48 SEM) mononuclear leukocytes.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 99/ 14233

## Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 14-16  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claims 14-16  
are directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.
